Overview

Chinese researchers have made a major breakthrough in optical communications and 6G wireless technologies, taking the global lead in realizing cross-network convergence between fiber-optic and wireless communication systems. The independently developed fiber-wireless integrated converged. The anticipated launch of the Sixth Generation (6G) of mobile technology by 2030 will mark a significant milestone in the evolution of wireless communication, ushering in a new era with advancements in technology and applications. 6G is expected to deliver ultra-high data rates and almost. With 17 key performance indicators targeted for validation across three final demonstrations, 6G-EWOC represents a leap towards realising the potential of 6G networks in enabling seamless, high-speed connectivity for the future. The 6G-EWOC project aims to contribute to the development of future. Internet connectivity is now considered almost a basic need—at least in developed Western societies—so it is foreseeable that users will demand even more bandwidth in the near future, as well as greater speed, security, and functionality. Important to this development is.
