

Filter Optical Path Module

Overview

This module specifies the Attributes of the optical paths used in the VL imaging. Each optical path is a combination of illumination, filters, lenses, and sensors, and each combination is identified for possible reference by Attributes in other Modules. Upon request, all photodiode - filter combinations can be provided with a NIST traceable. Bandwidth is also referred to as FWHM (Figure 1). For. Optical filters play a key role in many biophysical measurement applications, like fluorescence microscopy and Raman spectroscopy, including super-resolution techniques. For these applications, we offer in collaboration with prestigious filter manufacturers a comprehensive portfolio as well as. To accommodate for the desired concentration range to be monitored, the optical path length (OPL) can be adjusted by adding necessary optical windows.
