

# How much tensile strength is needed for a stranded optical cable

## Overview

Corning Optical Communications cable specification sheets are available which list the maximum tensile load for various cable types. The maximum pulling tension for stranded loose tube cable and ribbon cable is 600 lbF (2,700 Newtons). Refer to the cable specification sheet for the specific allowed. 6 strand x 19 wire (6x19) - minimum breaking strength, safe loads and weight. Minimum breaking strength and safe load for Bright wire, uncoated, fiber core (FC) wire rope, improved plow steel (IPS): The relationship between mass and force (weight) can be expressed as  $m = F / g$  (1) where  $F =$  force. The maximum permissible tensile load of a cable depends largely on three factors: For permanently installed cables with a concentric or stranded construction, the following formula should be used to calculate tensile strength: Example: A cable with 4 cores and a cross section of 2. You rely on this property to ensure the reliability of your cable during installation and operation. Proper tensile strength testing helps you prevent cable damage and maintain network. This test method applies to optical fibre cables which are tested at a particular tensile strength in order to examine the behaviour of the attenuation and/or the fibre elongation strain as a function of the load on a cable which may occur during installation and operation. This method is intended. For fiber optic cable, the tensile strength of a cable represents the highest load or pulling force that can be placed upon any cable before any damage occurs to the fibers or their optical properties and characteristics.
