

How to verify relay protection tripping prevention

Overview

ANSI/NETA MTS 2015 requires that you verify each of the protective relay contacts is performing its intended function in the control scheme, including breaker trips, close inhibit tests, 86 lockout tests and alarm functions. Ensure the reliability and safety of your protection system with Megger's specialised tools and accessories—ideal for testing auxiliary relays and handling complex or critical applications with precision and confidence. Testing protection systems doesn't stop at the relay. This equipment falls into two general categories: out-of-step blocking relaying and out-of-step tripping relaying. Where such appreciable current-carrying capacity is required, interposing contactor type elements will. This protective device continuously monitors the health of circuit breaker trip coils, preventing catastrophic failures before they occur.
