

PoE monitoring also requires a switch

Overview

A PoE network switch is a central hub that provides power and network connectivity to multiple IP cameras or other PoE-enabled devices. The following sections provide information about Power over Ethernet (PoE), the supported protocols, and standards and power management. powered device can receive redundant power when it is connected to a PoE switch port and to an AC power source. Using PoE power has a lot of benefits: Lower bill-of-materials costs because there is no need for a wall adapter or local power supply, nor is there a need for professional. A PoE switch is a network switch that utilizes PoE technology to transmit power and data over the same Ethernet cable to powered devices such as IP cameras, wireless access points, and VoIP phones, simplifying installation and reducing maintenance costs. It eliminates the need for separate power supplies, thus helping to streamline installation and reduce clutter.
