

Responses during optical cable line fault repair

Overview

The general principles for troubleshooting are as follows: First connect, then repair; Core first, edge after; First local end, then peer end; The fault should be handled by fault level in the network first and then out of the network. Different types of line faults have different processing priorities. (1) There is a backup routing optical cable that can pass through all-blocking faults. The personnel on duty in the computer room should jump-connect the business as soon as possible according to the emergency plan, use other good. The interruption of the optical cable line caused by external factors or the optical fiber itself, which affects the communication service, is called the optical cable line fault. Service interruption is not always caused by cable interruption. Fiber optic cable interruption does not necessarily lead to business interfix, which causes business interfix to be handled in the order of fault repair, without affecting the order of service. This document presents a troubleshooting guide for fiber optic cables once deployed and in regular use.
