

ST interface for plugging and unplugging optical modules

Overview

The ST (Straight Tip) interface is a circular metal bayonet-type fiber optic connector that was very common in early fiber optic networks. An optical fiber patch Cable is a jumper wire used to connect from equipment to an optical fiber cabling link, and it is usually used for the connection between an optical transceiver and a terminal box. It is widely applied in fields such as optical fiber communication systems, optical fiber. Unified standards are defined for housing dimensions and unlocking mechanisms, allowing smooth insertion, locking, unlocking, and removal of optical modules from the host port. SFP and QSFP are the most common optical port types in current mainstream equipment. Media converters are often used to extend transmission distances, improve network stability, and enable fiber access. Depending on the interface type, media converters. ST, SC, FC, and LC fiber optic connector interface differences, fiber optic connectors, that is, fiber optic connectors connected to optical modules, there are also many kinds, and they cannot be used with each other.
