

Screen power distribution box obstruction

Overview

First, inspect the main power switch and distribution box to ensure the circuit breaker is closed; reset or replace it if tripped. A fully black screen is one of the most urgent LED display issues, often linked to power supply or signal transmission failures. This may stem from tripped circuit breakers. However, users sometimes encounter issues such as failure to start, severe jumping during startup, or unstable operation. This article summarizes the common causes, professional troubleshooting methods, and startup precautions, helping operators solve these problems easily and extend equipment. Check the electrical load and ensure that the sensors do not exceed the 10 Amp maximum. Check the tightness of electrical connections along the power supply. Conventional power distribution will cheerfully pass 400V to the power supplies in your LED screen and at minimum, make the internal power supplies into scrap. Circuit breakers protect will only against over-currents, not over-voltages. This is a far too common problem.
