

Should cables be routed through the inner or outer ring of the cable tray

Overview

This is generally accomplished through a barrier strip within the cable tray. Which is the better practice in the event that piping must cross cable trays?

Is it dependent upon the pipe joining method or insulation?

If there's a chance of leakage I would think that routing the pipe under the cable trays would be better. Does the radiant heat from piping impact routing. Many cable tray rated cables include a crush and impact test as part of the listing and are rated as exposure rated (ER). Prevent cable damage during installation and maintenance due to overcrowding. Provide adequate air circulation. After determining the routing of the cabling, a network cabling project initially needs to consider the laying of cable trays, which can be made of metal, conduit, or plastic (PVC) tubes based on the material used. From the scope of tray-laying, it can be divided into work area trays, distribution. Coordinate with Building Structure: Cable tray routing should align with architectural design, avoiding unnecessary crossings, detours, or overlaps with other pipelines. Alternatively, cables can also.
