Physical Damage: From digging, agriculture, ground freezing, and surface activities. First, in order to demonstrate sufficient performance of an. Fiber optic cables transmit data as light pulses through a core, offering bandwidths up to 400 Gbps via wavelength-division multiplexing (WDM). Burying these cables protects them from physical damage, weather, and unauthorized access, but the depth varies based on location, cable type, and local. The short answer, based on general industry standards and the National Electrical Code (NEC), is that fiber optic cable is typically buried between 24 inches (60 cm) and 30 inches (76 cm) deep. However, simply hitting this depth isn't enough to guarantee your network survives.
