

The core switch is not responding when powered on

Overview

If a switch is not powering on or behaving inconsistently, first check: **Power Supply**: Ensure the switch is plugged into a working power source. Try a different power cable or power adapter (if applicable). If using Power over Ethernet (PoE), verify the PoE injector or power. are you using AC or DC power supplies with correct input?

if only 1 power supply not working from dual supplies, try to remove and replug power supply to device. **Looping or Broadcast Storms** – Overloaded network due to improper switch. We have a pair of Dell N3224P-ON switches and today's morning my colleague gave me a task and instructions to remove some unused VLANs. I'm sure I removed the correct VLANs. When I saved the configuration, everything stopped working and now we don't know what to do. The core switch is a netgear GSM735Sv2. (one of them a. When the switch is powered on, do the fans start?)

If the switch audibly turns on but no lights are on, allow it to run for a few minutes and see if the lights turn on.
