

The fiber optic cable on the power pole was cut by the power supply station

Overview

The first step is to locate the source and extent of the damage. You can use a visual fault locator (VFL), which is a device that emits a red laser light through the fiber, to trace the cable and spot any breaks, cracks, or bends. Besides the use of special cables on transmission and distribution towers or poles, the installation of fiber optic cables for utilities may require the shutdown of electrical distribution for installation, although some installations are possible without shutdown. Once these tools are ready, you can start the repair step by step. Locates fiber breaks and measures signal loss before and after. One way round this is to install aerial fiber cables close to power lines, such as on mixed use poles which also carry electricity. Isn't it enough to just bury the cables suitably deep or put them in conduits and stress that everyone should be careful when digging?
