

There is only one core switch

Overview

A core switch is the backbone of a network, managing high-speed data traffic between multiple segments. It's designed to handle significant amounts of traffic with advanced features like redundancy and scalability. Primary Role: Acts as the central hub connecting distribution switches and routers. In these switches, the data routed and switched. Is there something ultimately different in a core switch vs the other switches?

What is a core switch?

Is there ONLY one core switch in a network?

If there are more are they used differently?

Just curious about about core switches are. A good article on it would be nice if you got one. Sitting at the top of the hierarchical model, core switches interconnect distribution layer switches and provide high-speed data transfer across. Network switches are categorized into different types according to different principles, such as fixed switch and modular switch based if you can add expansion module to it, and managed switch, smart switch and unmanaged/dumb switch depending on whether you can configure it and the complexity of.
