

Thermal Expansion of Fiber Optic Ceramic Ferrules

Overview

The average coefficient of thermal expansion observed at the front face of the ferrules is 8 ppm/C from room temperature to 100 C. A ferrule's job is to hold the fiber core in perfect concentric alignment while maintaining extremely tight tolerances according to IEC 61755, IEC 61300. Hybrid injection-molded ferrules are presented which consist of a polymer body and an over-molded glass insert. This allows for such media to be deployed into enclosures and panels to form structured cabling solutions, or in patch cords to facilitate transceiver connections. High-purity Zirconia is special because it matches the fiber's thermal expansion. It also fights against chemicals. This helps your fiber connections stay strong in hard places. It is a microscopic sleeve with two core functions: Precision fixing: It securely holds one or more extremely thin glass optical fibers (typically with an outer diameter.
