

What is CDR for SFP optical modules

Overview

The full name of CDR is clock and data recovery, which can be simply understood as: after the optical signal is converted into an electrical signal, the receiver performs electrical domain shaping and clock recovery. Clock and Data Recovery (CDR) is a core function that ensures stable, error-free transmission for optical modules. clock-data-recovery-cdr-optical-modules-guide In today's high-speed digital era, optical. Clock recovery is the process of extracting timing information from a data stream to allow the receiver to decode the transmitted data. CDR bandwidth is an important indicator of CDR. It mainly affects the data lock time and jitter index of. In an era where information travels at the speed of light, optical modules, as the "bridge" of network communications, undertake the important task of converting electrical signals and optical signals, allowing data to be transmitted rapidly in optical fibers.
