

Working principle of gas phase spectrometer

Overview

MS works by ionizing gas molecules and separating the resultant charged particles by their mass-to-charge ratios (m/z) in an electric or magnetic field. This allows for the detection of even trace substances with outstanding sensitivity and specificity. Some of the infrared radiation is absorbed by the sample and some of it is passed. Gas chromatography/mass spectrometry (GC/MS) combines two analytical tools to identify and measure the concentration of chemicals found in foods, consumer products, pharmaceuticals, fuels, the environment, and more. Mass spectrometry's ability to provide. Like many other samples, a gas (or vapour) can be analyzed using the transmission of an infrared beam through the sample, reading the strength of the various wavenumbers upon exiting the sample and arriving at a detector. Carrier gas, like helium, hydrogen or nitrogen, works as a mobile phase, while.
